A ROBUST SPECTRAL METHOD FOR FINDING LUMPINGS AND META
STABLE STATES OF NON-REVERSIBLE MARKOV CHAINS

MARTIN NILSSON JACOBI

Abstract. A spectral method for identifying lumping in large Markov chains is presented. The identification of
meta stable states is treated as a special case. The method is based on the spectral analysis of a self-adjoint matrix
that is a function of the original transition matrix. It is demonstrated that the technique is more robust than existing
methods when applied to noisy non-reversible Markov chains.

Key words. Markov chain, stochastic matrix, metastable states, lumping, aggregation, modularity, block diag-
onal dominance, block stochastic
